

I am filing this comment in reference to comment supplied by Fredrick M. Spinner WOFMS of 07/10/2003. I am also an electrical engineer employed by the U. S. government for the past 36 years. I agree with Mr. Spinner that it would be very easy to "RUIN" the RF spectrum throughout the country if BPL is adopted with no regard to spectrum defense. The idea of implementing this new technology is exciting, but it must be done with care and protection for the other users of the RF spectrum, of which the U.S. government is a major one. In addition, I believe the hidden costs of implementing this technology will prove it is not the most effective means to deliver broadband. In any case, it should be well tested before acceptance, to prove it is not the potential RF polluter which it appears it will be.
