

Several of the proponents of BPL have stated that the system will not cause interference to licensed users. They have presented no evidence to back-up this claim. To the contrary, modeling and measurements by Europe, Japan, and the ARRL indicate severe interference will result from this system. The proponents, although they claim that BPL will not cause interference, nevertheless are asking for relief from Part 15 rules. This indicates that know they will cause interference at the present Part 15 levels and thus they need relief to deploy their system within FCC rules.

Based on the severe interference that BPL will cause to over one million licensed users in the United States, I strongly suggest that the FCC reject the deployment of the BPL system
