

I fully support the comment submitted by the American Radio Relay League concerning Docket ET 03-104. Issuance of an approval of the BPL system would compromise the primary licensees of the frequency spectrum from 2 MHz to 80 MHz. This sets a dangerous precedent of allowing future legislation to override existing services with little regard to the impact to these services. Many credible sources from around the globe have scientific data to prove that BPL would cause serious harmful interference to existing services in the above frequency range, of which the military is one of these services. If the proponents of BPL are serious about their proposal, they will have to develop this technology in a way that will not cause irreparable interference to primary services. BPL is not in the best interest of the public.
