Subject Docket 03-104 Broadband over Power Line

I support the Comments submitted by The American Radio Relay League concerning Docket ET 03-104. The comments by proponents of Broadband over Power Line have little scientific data to support approval of this docket. Much more research is required to avoid the great potential of increased noise interference this technology will cause. The existing licensed services operating in the 2 MHz to 80 MHz frequency range will suffer irreparable harm from radiated noise resulting from passing broadband signals over the vast power network. Talk about a great antenna system.

Approving Docket 03-104 is to violate existing FCC rules on non-interference and is contrary to the best interest of the public in general.

Sincerely,

Peter F. Giblin
