

As an amateur radio operator, a shortwave radio listener, an internet user, and a professional computer programmer, I have been following this docket with interest. Although I have read in detail the details of the studies on potential high frequency spectrum interference conducted by the American Radio Relay League, I can find no information regarding alternate studies which indicate that unacceptable interference will not be a problem. Please take all necessary steps to assure that unacceptable interference to various forms of high frequency communications, especially two-way amateur radio communications will not result from implementation of BPL.
