

I am writing to state my vehement opposition to the current proposal to provide broadband communications over power lines. The RF interference that it has been proven to cause is reason enough to deny the power companies the right to operate broadband using the current technology. They should be required to make improvements in the technology until they can prove that RF interference will not be an issue. In the event of an emergency, the interference will prove a possible risk to human life and property if the appropriate personnel are not able to use their radios. There are many devices that have been denied FCC approval for less interference. There is no reason to grant the power companies this approval.

Thank you,

Mark Rosengarten
