

As a broadband computer user I could benefit from BPL. However, it is important to me and other citizens that current communication systems remain unaffected by the possible interference from Broadband over Power Lines. Perhaps rural areas with only satellite as a choice of broadband providers could benefit the most from this technology and would be least affected by the interference. City areas already have choice of DSL, cable, and satellite broadband providers and will suffer negative effects from BPL radio interference with radio communications in the 2 to 80 MHz frequencies.
