

I still feel that the electromagnetic spectrum should be public domain and not a taxable, restricted thing. Like the air we breathe electromagnetic radiation washes over us continuously. The regulations that make it illegal to monitor that impinging radiation is absurd and anti-competitive. What it does is shift the responsibility for protecting transmitted information from the business or military entity to the courts. That is not the proper use of law and regulation. It removes incentives for developing technologies to keep those transmissions safe. Granted that control of what and at what frequency or mode transmissions are made is a proper area that the FCC should be involved in.
