

I feel that Broadband transmissions over Power lines should undergo much more testing before it is put to use. The Amateur Radio Community has through testing shown many interference difficulties with this proposed transmission.

The International Telecommunications Union (ITU). The highly regarded British Broadcasting Corporation (BBC) has shown by test in Scotland that it will interfere in a very drastic way with the radio frequency spectrum.

The Australian Communications Authority (ACA) has shown a potential risk to HF radio communications services appears to exist.

I think it is time the FCC did what they are supposed to do "Protect the Radio Spectrum" and stop being a cheerleader for BPL.

There is no way FCC can stretch the Part # 15 of the regulations to cover BPL.
