

Please do NOT turn over the ITFS/MDS band in the 2.5ghz frequency to the cellular industry. This frequency should be used to extend the existing 2.4ghz unlicensed spectrum instead of being turned over for use by the cellular industry. The wireless revolution would not be possible without the existing unlicensed band where 802.11b technology operates. Unfortunately this band is getting more and more crowded with applications and users. Additional spectrum will be required in the near future to keep the Wi-Fi revolution going. Individuals should have equal access to the airwaves not just huge corporations. The frequency spectrum is a common good that belongs to all Americans and should not be given away to rich telecommunication companies. Giant corporations already control access to television networks, don't let this happen to the rest of the spectrum. If the coalition of private interests behind the proposed changes to the ITFS/MDS band get their way it will result in huge give away of valuable spectrum to the cellular industry and a historic opportunity to provide more unlicensed spectrum will be missed.
