

I would like to see the BPL idea cancelled. There is plenty of noise generated from the 60 cycle power distribution system in this area with out adding additional radiation from the frequencies used for BPL. The noise in this area extends into the UHF frequency range and the local utility has never been able to fix it.

The power distribution system does not make a good balanced transmission line at VLF, LF, MF, HF, VHF and UHF frequencies and would be poor at preventing radiation.

Please defeat this measure and stop further polution of the spectrum.

The utility companies can barely keep the systems operational without adding a further burden, not to mention the lack of skill in resolving the current power line interference issues around the country.

Thank you.

Paul T. Mason
