

I believe your enthusiastic acceptance of the BPL technology unrealistic. This technology is flawed to the point that other Nations and various test localities have abandoned deployment plans or banned it's use completely. Without realistic, impartial testing, you are providing a means of extensive RF interference to both public and private communication systems, Amateur radio, Emergency communications, Defense communications, and more.

How could you ever imagine that the Power companies, who are already known to be uncaring, unwilling, or unable to handle present noise complaints about existing electrical transmission systems will be able or willing to effectively maintain and operate a non-interfering BPL system.

Further, the technology although flawed, is already antiquated. Wireless technology is more reliable and electronically environmentally sound.
