

It is unbelievable that the FCC is really considering to approve BPL. I believe that more people have not responded because they believe that the FCC would uphold their duty and help protect our airwaves instead of selling out to big business.

There are many ways that people can get broadband wired and wireless. The idea that after so many years of fine service to the communications world that the FCC would support something that will damage the communications of this country is unbelievable. I am a amateur radio operator with Emergency Communications groups. Utility companies can not handle what's on their plates now. Why do they want more and why is the FCC endangering our airways to give them more?

I am totally against BPL and everyone that I have spoken to is against it. There is no way possible to have BPL without harmful interference to many services.
