

Broadband over powerlines is not a good idea. It will not sell, especially when people find that their internet connections are subject to frequent interferences. Even more of concern is BPL's negative results on radio waves used by emergency and law enforcement units and other organizations. This idea is something that must be researched strongly overtime. The small city test areas should be broadend to a national test. For the FCC to cater to deep pocket investors in BPL without enough research regarding its negative consequences is rehenceable. Remember, you are supposed to represent the mass public and take into consideration the negatives, along with the positives. And make a decision only after regide research. Once again, the current research should be broadened from a few small areas, to a nationwide test. Then, the real effect of BPL on community communications would be known. People first, deep pockets last.
