

BPL is redundant, therefore unnecessary. In addition, it can, if implemented, cause widespread RFI in the amateur radio bands in areas of the world far removed from the geographical areas it is designed to serve. If there were no other broadband options, I would feel differently; however, the radio bands are precious and useful to the world community, and are already cluttered with RFI from frequency use from a multitude of electronic, wireless devices. Let's not destroy the last domain of radio networks worldwide or here in our own backyard, with yet another broadband technology. The existing frequencies are like our natural resources in that they should be protected from interference and destruction, because they are valuable as they stand.
