

I ask the administrators of the FCC to carefully consider the effect that Broadband over Power Line can have on ALL communications media. Mixing products caused by poor connections on ground conductors, guy wires, metal gutters and other metallic items can cause the BPL signal to be re-radiated at any frequency occupied by TV or other high power stations by generating spurious emissions on either side of the subject high power signal. Please consider this aspect when studying the effects of BPL.

Thank you,

Tony A. Stone
