

I am an avid shortwave listener and an amateur radio licensee. It would be unfortunate to have either of these (licensed) activities closed to me because of a poorly-engineered alternative to other more capable broadband delivery systems.

Several other nations have already tested and rejected BPL. The technology being proposed in the US is not substantially different from these previous attempts, so why not take the lesson learned from these other programs and delay BPL until a system that produces fewer spurious emissions can be developed.

Sincerely,  
Matthias Granberry
