

Sirs,

I am opposed to the proposal to permit Broadband Over Power Lines (BPL) to operate in the US. The probability of interference in allocated RF spectrum outweighs any benefit the public might enjoy from yet another source of broadband data services.

With DSL, cable, one-way and two-way satellite, and local fiber initiatives delivering broadband data services, I fail to see the need for yet another broadband service which will very likely result in interference with allocated RF spectrum. Please rule against this proposal.
