

BPL is, without doubt, a very big mistake. The Japanese tried this venture and the testing lasted only 2 days, while the British testing effort was cut after 3 days. BPL is an enormous noise generator with the PL radiating for miles. It becomes a case of RF noise pollution to the extent that the EPA should be, and will be, advised that the entire communications network will be interfered with by this noise pollution. Emergency radio networks will suffer severe consequences. Dept of Homeland Security must be informed and involved in this as BPL will be extremely detrimental to this Nations Security. FCC must take a second look at this venture.
