

Dear FCC,I have heard a lot of the issue from both sides. I have read some of the NPRM (what I could understand of it). Even though it would be great to be able to have affordable broadband internet, I feel that the power lines in place will not be able to handle the digital traffic. The blackout this past year in the north eastern part of the US shows this. If the power companies cannot keep the lines maintained for daily use, then how is the digital signals supposed to not cause interference. The different public and private radio services as well as the digital signal itself will be affected.

The BPL issue needs researched more before the rules start getting changed allowing it. It feels like this issue was rushed through the system because "It was cool" and not because it is a stable and PROVEN system.
