

With the unlimited potential for interference to all frequencies between 0 - 60 Mhz and above, I cannot there is not an alternative to this.

Furthermore with the strong opposition by the power companies to allow amateur radio to operate operators in a segment in the area of 137 KHz due to the power companies concern of interference, it seems the power companies have done a double take, and it appears concern of interfering with the power grid has been replaced with the apparent need to make more money.

I live in a town of 230 people and if I have DSL service available to myself, there is no reason all cant have it.
