

I am against broadband over powerlines. This will cause extreme noise and interference to high frequency radio communications. The powerline system in this country is not shielded properly to permit this kind of operation without replacing the current powerlines which would cost an enormous amount which would be passed on to consumers. The FCC's "opinion" that BPL would not cause any serious interference is incorrect and is not based on factual data. BPL would cause major problems with the Amateur Service, Government and City emergency communication services, Military communications, and the Military Affiliate Radio Service.
