

Only radio operators really know how much BPL is going to make things harder for communications services. I've talked to CBers who are buying linear amplifiers to counter the BPL, and this will no doubt interfere with BPL's transmissions. FEMA is against it, so should the FCC. It seems more logical to develop DSL so broadband could reach everywhere there is a landline telephone. That wouldn't interfere with anything, really. I get the distinct impression that BPL is backed by the right powers-that-be and it's going to go through regardless of any opposition. Thanks for your attention.
