

I don't like broadband over power lines, because I am happy getting broadband over phone lines, also broadband over power lines can receive interference from mobile communications, such as public service radios, business mobile radios and cellular phones, there is no way to filter the noise from these devices. Broadband over power lines have been tried in other countries like Japan and England and have failed. I think this needs more technical study before implementing this service. We should leave the internet to the phone and cable companies and the electricity to the electric companies.
