

I think there is much we all will lose if we allow BPL to operate. It gains us no solution to broadband in remote areas as a last mile installation as it isnt being implimented that way in test studies. Most are in urban areas. The noise caused to licensed services in the HF frequency spectrum has been proven to be terrible and far beyond what other broadband services cause. Why license technology that is already outmoded (new wireless cellular BB on the horizon) And causes interference to AM broadcast through VHF services. Keeping competition is healthy for the communications industry. Lets not undercut one service for another one.
