

Dear commisioners,

I am licensed in several services, Amateur, Shipboard and GMRS. I hold a General Radiotelephone and have been involved in all aspects of Radio, Television, computers and the Internet over my electronics career spanning 30 years.

Computer communications should not be a radiating service unless that bandwidth is set asside in dedicated spectrum.

A quiet HF radio spectrum is a national and world treasure enabling point to point communications in the Microvolt range, BPL will destroy that ability.

Powerlines are inherantly noisy and they are giant radiating antennas in their own right. 1 well placed EMP pulse will not only detroy this country's power grid, but take down the BPL system also.

If this country is goign to be at war, lets think up new systems that don't trash up the radio spectrum and are totally vulnerable to enemy attack.

I know you guys are smarter than that.
