

I am very concerned with the prospect of Broadband Over Power Line being implemented. I have to admit, the idea sounds good, but if other countries have tried it, and cannot get it to work without causing interference, I am wondering how we plan to do it.

I have heard the argument from the FCC, that BPL over the powerline would allow everyone to have broadband internet access at their home. With the introduction of satellite internet access, just about everyone should be able to have access to broad band internet access.

Before filling out this form ... I also noticed a docket on the preceding page called "BPL over telephone lines".

Now .. if there is technology that allows us to have BPL over telephone lines, why would we even take a chance of causing interference sending BPL through a non shielded cable?
