

The FCC really needs to consider the effect of BPL on other radio services. Even though the power level used in BPL is relatively low, there is a huge potential for interference on the Amateur Radio bands. The frequency range used is favorable for propagation and this interference could occur a half a continent from the source which would make tracking down the interference difficult at best. Look at how well amateur radio operators communicate with QRP. BPL is definitely not in the best interest of users of the radio spectrum.
