

Anyonw that claims that the broadband over power line causes no interference to the HF frequencies has not actually listened to the ham bands when BPL has been in use or was being tested. I have first hand experience listening to the warrble, and buzz tones that occur when data is transmitted on power lines. This interference occured when Alliant Energy of Cedar Rapids, Iowa conducted these tests. For all practical purposes, it made the HF bands useless. Please check this out first hand and you will hear for yourself. Please protect the HF bands from this invasion. Other means of high speed internet do exist, and will probable be cheaper in the long run
