

I would urge you to thoroughly review the interference that has occurred to the HF spectrum in areas and countries where BPL has been tested and, in fact, has not been approved because of the serious level of interference. This technology is not "nirvana" as has been claimed. While the end goal is a noble one, the BPL method is neither the best nor the only solution. To date, the power utilities have been unable to maintain their existing infrastructure so that both interference and outages are prevented. With BPL, the problem will only be heightened. Thank you.
