

Professionals and Amateurs alike have proven most implementations of BPL to cause harmful, often obliterating, interference to some of the most useful Long Range communication spectrum, specifically, HF frequencies, to include 6 meters.

I support the concept of BPL.

I absolutely do not support typical implementations which have proven the world over, to emit harmful RFI.

So far, only one company seems to have proven and has publicly stated that they can deliver BPL without harmful RFI.

They claim to offer over 3x the throughput with zero RFI in the HF regions.

They claim to have done this by operating their BPL Trial systems in the microwave region of the spectrum.

If this is actually true, and can be implemented, it is thus far the only publicly known, acceptable form of BPL at this time.
