

I want to express my opposition to FCC support of BPL systems that utilize the HF and low VHF spectrum for data transmission. Studies detailed in other filings have shown that severe interference to users of this spectrum will occur. In addition, licensed users of this spectrum will cause interference to the BPL systems, rendering them, at times, unusable to the subscriber.

BPL systems operating in the UHF/SHF and higher frequency ranges may work and should be further studied. It has already been proven, as detailed in many of the other filings on this docket, that BPL in the HF/VHF range is not workable and should not only be discouraged by the FCC, but should be totally banned.
