

Dear FCC

I have been involved with High Frequency (HF) radio Communications in the military and Amateur Radio community since 1960. I feel that the current trend to increase transmission speeds on the internet, specifically BPL will do extreme damage to the hobby and service provided by HF communications. To quell or suppress HF communications reliability or interest in amateur radio will surely diminish future technical input and public support during emergencies to the country from a select group of individuals that have made very significant contributions in the field of public service, general communications, electronics inventions and industrial advances. Please reconsider this threat to a mode of communications and technology that has served our country well over the years and will continue to always be available to serve whenever and wherever called upon. Respectfully, Alfred S. Carlson wa7uhr.
