

From what I read, BPL will radiate RF energy from unshielded lines in frequencies from 5mhz through 80 mhz, and will certainly be audible in frequencies assigned exclusively to the Amateur Radio Service. There is no level of audibility which will not interfere with amateur radio operations. Other countries have considered this and rejected the practice. I submit that this is not a balancing of priorities nor enhancement of business interests, it is an intrusion into long protected territory and an erosion of the service available in the amateur radio spectrum. Use other frequencies, please.
