

living in a congested area of the city,i do not have the ability to change antenna directions,as some people have suggested to minimize interference. my personal experience with light dimmers,energy-efficient light bulbs,flourescent light bulbs, tv with switching power supplies,etc. that my neighbors have are causing havoc with background noise on a daily basis on the hf ham bands. to allow additional levels of noise from devices that are supposedly part 15 compatible on a broadband basis is intolerable.
