

I been an amateur radio operater for over 20 years. I would like the FCC to reconsider the Proposed BPL Rules. The problems it will cause with interference will cause major problems for the amateur radio coummunity, military and governement HF services and the general public who listen to shortwave radio.

Amateur radio and its services to the public community will be greatly effected from the side effects of BPL. There are other medias that provide better broadband service to the public.

Please listen to the research and those who have had experience with BPL. You will find these studies on the ARRL site.

Another side effect is that the general public will not realize what is causing the interferance to their equipment. I became interested in amateur radio as a kid listening to the shortwave radio. If I had encountered and heard the type of problems BPL can cause back then I doubt I would of gotten my license. Also with the problems BPL will cause you will lost some of the amateur community. We can't afford for this to happen in todays world.
