

The use of power lines to handle broad band internet is like asking the phone lines to carry high voltage. They were not set up to carry this type of information and will case a considerable amount on interference on the 2 through 80 MHZ frequencys.

I do not believe the power companies have any intention of clearing up this problem and I think anyone who is operating a transmitter on these frequencys will case a problem for near by computer internet users.

Please take another look at this proposal and really do some FIELD CHECKING!!
