

BPL in its current form is not fit for deployment. Several studies have been done that clearly indicate - while Internet connectivity can be provided - there is also a significant level of interference generated by the BPL signalling. It has also been demonstrated that interference from nearby transmitters can disrupt the BPL service. BPL requires re-engineering (allocate spectrum above 80Mhz for BPL only?) before deployment. Therefore I DO NOT support deployment of the BPL systems that are designed to 'share' spectrum with licensed services.
