

I am very concerned about BPL interference with my ability to receive Short Wave Broadcasts. The entire spectrum may be lost to interference caused by BPL. Would it be possible to shift the BPL spectrum higher, to say 5Ghz, this would cut down on interference and not cause loss of communications in the HF and VHF bands. This is important to FIMA and local law enforcement agencies that have not swithced to 800Mhz band. Please do NOT allow power companies to institute BPL in this country. Other countries have tried and found the idea of RF radiation from power lines to be onerious and have stopped the service in their countries; Greate Britian and the Netherlands, also Japan. Take their lead to proceed with this process if you must, but make the power companies responsible for non-interference.
