

Gentlemen, I feel strongly that the FCC's plan to approve implementation of BPL will be doing Amateur Radio and other users of the HF radio spectrum a great service. Not enough care has been given to testing of the interference potential of BPL and tests other than the FCC point towards these problems. There are other ways both ready for roll out and in the planning stage that will provide greater service to the user and as a plus will not prove disasterious to users of the HF spectrum. If you chose to continue your planned approval of BPL at least please listen to the voices that are being raised in protest and extend your testing to allow greater testing.
