

This has got to be one of the worst ideas ever. I have used several forms of non-polluting broadband internet connections and all seem to work great. Right now I am at home on my good ol' 56k running at 40k and I am not wishing for a magic internet connection to run into my power lines. This idea is absurd and is for an impatient and "cheap" government. Instead of trying to innovate some quick alternative to cabling the United States, you should just go with what works and what doesn't have the potential to make miles of electrical wires into static broadcast antennas.
