

Our business serves a large number of commercial and residential clients in rural Western Oregon. The additional spectrum in the 3650-3700MHz band would be extremely helpful in the deployment of more broadband services in our area. We need spectrum that we can dedicate to backhaul links. Currently we use 5.8 Ghz, but that spectrum is rapidly depleting in usefulness as more PTMP systems are deployed.

It is my understanding that this frequency range is already adopted for use in Europe and Canada. It would make sense from a manufacturer's standpoint to make it available for unlicensed use in the United States also. The equipment is already available and it will facilitate a quick adoption of this spectrum.

Thank you,
George Rogato
