

As a small wireless ISP in an area which the local cable provider simply refuses to serve, the availability of spectrum is crucial to my survival, and to providing broadband access to local residents. Without unlicensed spectrum, I would not be able to afford to provide service, which is why I am absolutely for opening the 3650-3700

MHz bands for unlicensed operations. I would, however, like to see the FCC impose some restrictions on the usage of the unlicensed bands much like parts of South America. For instance, opening the lower part of the band to anyone's use, but the upper part only for "outdoor" use. That type of use, I believe, would help promote broadband access to rural areas while minimizing the problems of localize interference.
