

As the largest WISP in our area, we are seeing a desperate need for more spectrums to use and I think the 3.6GHz band is the perfect candidate. This is largely due to the fact that currently the latest 802.16 or WIMAX equipment which is being shipped out today to other countries is unusable in FCC territories.

Currently we are already implementing frequency reuse on some of our towers however the potential of self-interference has largely halted the expansion of operations in some areas.

We look forward to seeing a favorable turnout in these decisions.
